Complete Java Notes

Introduction to Java

Java is an object-oriented programming language.

```
// Example of Introduction to Java
class Demo {
    public static void main(String[] args) {
        System.out.println("Learning Java");
    }
}
```

Variables

Variables are containers for storing data.

```
// Example of Variables
class Demo {
    public static void main(String[] args) {
        System.out.println("Learning Java");
    }
}
```

Data Types

Java supports int, float, double, char, boolean, and String.

```
// Example of Data Types
class Demo {
    public static void main(String[] args) {
        System.out.println("Learning Java");
    }
}
```

Conditional Statements

if, else, switch are used for decisions.

```
// Example of Conditional Statements
class Demo {
    public static void main(String[] args) {
        System.out.println("Learning Java");
    }
}
```

Loops

for, while, do-while loops are used.

```
// Example of Loops
class Demo {
    public static void main(String[] args) {
        System.out.println("Learning Java");
    }
}
```

Methods

Methods are reusable blocks of code.

```
// Example of Methods
class Demo {
    public static void main(String[] args) {
        System.out.println("Learning Java");
    }
}
```

OOP

Java fully supports object-oriented programming.

```
// Example of OOP
class Demo {
    public static void main(String[] args) {
        System.out.println("Learning Java");
    }
}
```

Exception Handling

try-catch-finally handles exceptions.

```
// Example of Exception Handling
class Demo {
    public static void main(String[] args) {
        System.out.println("Learning Java");
    }
}
```

File Handling

Java uses File class and streams for files.

```
// Example of File Handling
class Demo {
    public static void main(String[] args) {
        System.out.println("Learning Java");
    }
}
```
